

[Tinder feed]

- proximity
 - how to make more people match? → interests
 - how to make ~~user~~ geospatial updates?
 - we want to keep track of users' location every x minutes
- $userid < lat, long > (expiry)$
 $\begin{matrix} 4B & 4B & 4B \end{matrix}$
- (12B) x $\rightarrow$ SUM users = $600 \times 10^6 \times 12B = 600MB$
 location $\rightarrow$ redis db's.
- so, to store the data is not the issue here.
- But handling compute for those many people is an issue.
- users

So the database needs to have

- ① fast writes
 - ② handle geospatial
 - ③ scalable queries
- redis serves well here

for scraping the data:-

- user login with twitter / facebook / gmail
- scraping the user data, it stores everything on enrichers. profile db it is saved in

redis geospatial
feed bloom filter
